

The Website Audit Checklist

37 checks across technical SEO, performance, security, accessibility and conversion — the same categories we review on every audit we run for clients. Work through this before your next redesign, or use it to sanity-check your current site.

Technical Foundations

- Site loads in under 3 seconds on mobile (test: PageSpeed Insights)
- HTTPS is enabled site-wide with no mixed-content warnings
- A single canonical version of the site exists (no duplicate www / non-www or http / https versions both live)
- robots.txt exists and doesn't accidentally block important pages
- An up-to-date XML sitemap exists and is submitted to Google Search Console
- A custom 404 page exists and links back to key pages

On-Page SEO

- Every page has a unique, descriptive title tag under 60 characters
- Every page has a unique meta description under 155 characters
- Each page has exactly one H1, with a logical heading structure below it
- Target keywords appear naturally in titles, headings and body copy — not stuffed
- Internal links connect related pages using descriptive anchor text
- Images have descriptive alt text (not just for SEO — also accessibility)

Structured Data & Local SEO

- Organization/LocalBusiness schema markup is implemented and validates
- FAQ schema is added to any page with genuine FAQ content
- Google Business Profile is claimed, verified and fully filled out
- NAP (Name, Address, Phone) is consistent across the site and all listings
- The site appears correctly in local map-pack searches for key terms

Performance

- Images are compressed and served in modern formats (WebP/AVIF)
- CSS and JavaScript are minified; unused code is eliminated
- Critical CSS is inlined so above-the-fold content renders fast
- Fonts are loaded efficiently (not blocking render, no duplicate requests)
- A CDN or edge-hosting layer is in place for global visitors

Security

- Security headers are configured (CSP, X-Frame-Options, etc.)
- All forms have spam protection (honeypot fields and/or CAPTCHA)
- API keys and secrets are never exposed in client-side code
- Dependencies are kept up to date and scanned for known vulnerabilities
- Public-facing endpoints have rate limiting to prevent abuse

Mobile & Accessibility

- The site is fully usable on a real phone, not just a resized browser window
- Tap targets (buttons, links) are large enough to hit reliably
- All form fields have real, associated <label> elements
- Color contrast meets WCAG AA for body text and buttons
- The site is fully navigable using only a keyboard

Conversion & Trust

- Contact information (phone, email, WhatsApp) is visible without scrolling
- There's a clear, singular call-to-action on every key page
- Real testimonials, case studies or reviews are visible, not just claims
- Forms confirm submission clearly and explain what happens next
- Analytics is installed and goals/conversions are actually being tracked
